

## ABSTRACT

The invention relates to a system and method to publish, match and access messages without any predefined format. It provides methods, software and apparatus for receiving and matching  
5 messages sent by different users and forwarding the matching results to concerned users. The system receives a message (eg. by email, SMS, voice mail, fax, telephone), converts it into text data when needed, identifies keywords, stores it, looks for previously stored messages with corresponding keywords and forwards the matching messages to respective senders. The system provides a method to publish and search other published messages by one action. It is useful for  
10 matching buyers' and sellers' needs.

Figure 1. Schematic representation of the experimental design. The subjects were divided into two groups: the control group (CG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the control group (CG). The EG was divided into two subgroups: the experimental group (EG) and the experimental group (EG). The subjects were divided into two groups: the control group (CG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the control group (CG).
